

NASM Intel x86 Assembly Language Cheat Sheet

Instruction	Effect	Examples
Copying Data		
mov dest,src	Copy src to dest	mov eax,10 mov eax,[2000]
Arithmetic		
add dest,src	dest = dest + src	add esi,10
sub dest,src	dest = dest - src	sub eax, ebx
mul reg	edx:eax = eax * reg	mul esi
div reg	edx = edx:eax mod reg eax = edx:eax ÷ reg	div edi
inc dest	Increment destination	inc eax
dec dest	Decrement destination	dec word [0x1000]
Function Calls		
call label	Push eip, transfer control	call format_disk
ret	Pop eip and return	ret
push item	Push item (constant or register) to stack. I.e.: esp=esp-4; memory[esp] = item	push dword 32 push eax
pop [reg]	Pop item from stack and store to register I.e.: reg=memory[esp]; esp=esp+4	pop eax
Bitwise Operations		
and dest, src	dest = src & dest	and ebx, eax
or dest,src	dest = src dest	or eax,[0x2000]
xor dest, src	dest = src ^ dest	xor ebx, 0xffffffff
shl dest,count	dest = dest << count	shl eax, 2
shr dest,count	dest = dest >> count	shr dword [eax],4
Conditionals and Jumps		
cmp b,a	Compare b to a; must immediately precede any of the conditional jump instructions	cmp eax,0
je label	Jump to label if b == a	je endloop
jne label	Jump to label if b != a	jne loopstart
jg label	Jump to label if b > a	jg exit
jge label	Jump to label if b ≥ a	jge format_disk
jl label	Jump to label if b < a	jl error
jle label	Jump to label if b ≤ a	jle finish
test reg,imm	Bitwise compare of register and constant; should immediately precede the jz or jnz instructions	test eax,0xffff
jz label	Jump to label if bits were not set ("zero")	jz looparound
jnz label	Jump to label if bits were set ("not zero")	jnz error
jmp label	Unconditional relative jump	jmp exit
jmp reg	Unconditional absolute jump; arg is a register	jmp eax
Miscellaneous		
nop	No-op (opcode 0x90)	nop
hlt	Halt the CPU	hlt

Instructions with no memory references must include 'byte', 'word' or 'dword' size specifier.

Arguments to instructions: Note that it is not possible for **both** src and dest to be memory addresses.

Constant (decimal or hex): 10 or 0xff Fixed address: [200] or [0x1000+53]

Register: eax bl Dynamic address: [eax] or [esp+16]

32-bit registers: eax, ebx, ecx, edx, esi, edi, ebp, esp (points to first used location on top of stack)

16-bit registers: ax, bx, cx, dx, si, di, sp, bp

8-bit registers: al, ah, bl, bh, cl, ch, dl, dh
